PROBLEM STATEMENT:

Age Calculator using C- Programming.

PROJECT DESCRIPTION:

Age calculator is a tool to calculate age from date of birth to current date. The output format of the time difference is in terms of years, months and days. The calculation of age does not depend on the time zone of the person as the output is the difference of the time. This age calculator is created on the basis of most common age system, so that it stays relevant for most of the people. Also, this calculator helps identify the stages of human life based on the generated age.

REQUIREMENTS:

✓ **Hardware Requirements:**

Processor: Intel dual core or above
Processor speed: 1.0 GHZ or above
RAM: 1 GB RAM or above
**Hard disk:** 20 GB hard disk or above

✓ **System Requirements:** Windows or Linus

✓ **Software Requirements:**

Programming Language: C

Platform: C

✓ **Functional Requirements:**

Leap Year   To check if the given year is leap year or not.
